1. In this retrospective cohort study, how were the participants identified? Do you think all cases were identified using this method? Why or why not? If not all cases could be identified using this method, how would those not identified impact the findings? Why were this study design and method for inclusion selected? Describe the strengths and limitations of the study design and method of inclusion.

2. Why do you think the authors chose to exclude crashes involving large trucks, buses, and motorcycles?

3. In the discussion, the authors describe the limitations of their inability to control for the change in velocity and maternal injury severity; how would you design a study to address these limitations?

4. Do you discuss motor vehicle safety with your pregnant patients? If yes, when (first, second, or third trimester) and how? Describe your counseling process.

5. Do you assess if your patients wear their seatbelts and/or have an airbag in their car?

6. How do you recommend that a pregnant woman position the seatbelt? Where should the cross-strap fall? Does it differ in the three trimesters?

7. Will the findings from this manuscript alter your practice in managing pregnant women? What changes, if any, will you make?
