Evidence-Based Guidelines and Measures

Evidence-Based Clinical Practice Guideline: Autologous Breast Reconstruction with DIEP or Pedicled TRAM Abdominal Flaps

The tumescent face lift provides ease of dissection, improved visualization, and hemostasis. It is ideally suited for lipodissection (tunneling) and an extended SMAS dissection to adequately tighten the platysma and elevate the facial soft tissues. The video describes the technique through a series of interdependent maneuvers and details the subtle, but necessary, superior/anterior rotation of the SMAS in order to achieve an excellent outcome without midline platysma plication.
