Baker Gordon Symposium Video
PRSJournal.com Exclusive
Lecture Video
Safety in Gluteal Augmentation
Daniel Del Vecchio, M.D.

The mortality rate from gluteal fat grafting is unacceptable. Despite efforts at defining “safety zones” and “angles” of cannula direction, the crux of the problem appears to be the depth of cannula penetration and not the angle of insertion nor the zone of the gluteus muscle injected. Dynamic cadaver studies demonstrate that fat placed just beneath the gluteus maximus fascia will migrate deep to the submuscular space with the potential for venous tear and pulmonary fat embolism. A call is hereby made for a halt to fat grafting beneath the fascia of the gluteus muscle.

To watch the lecture video, go to www.PRSJournal.com.
